

Engineering Standards & Workflows

1. Introduction

This document outlines the coding standards, code review processes, and Git workflows for the engineering team. Adhering to these standards ensures code quality, maintainability, and consistency across all projects.

2. Coding Standards

Python: We follow PEP 8 standards. Use Black for automated formatting and Flake8 for linting. Type hints must be used for all function signatures.

JavaScript/TypeScript: We use ESLint with the Airbnb configuration. Prettier should be configured in your editor for auto-formatting. TypeScript is required for all new front-end features.

3. Code Review Process

All code must go through a peer review process before being merged into the main branch. A pull request (PR) requires at least one approval from a senior engineer or code owner.

Reviewers should check for logical errors, adherence to standards, proper test coverage, and clear documentation. Be constructive and respectful in your feedback.

4. Git Workflow

We utilize a feature-branch workflow. Branch names should follow the pattern: feature/TICKET-ID-short-description or bugfix/TICKET-ID-short-description.

Commit messages must be descriptive and follow conventional commits format (e.g., feat:, fix:, docs:). Squash commits before merging to keep the history clean.
