

Internal Training: Agile & Scrum Basics

1. Intro to Agile

Agile is a framework for developing products iteratively. It emphasizes flexibility, continuous improvement, and team collaboration over rigid planning.

2. Scrum Framework

We operate in 2-week Sprints. Each Sprint begins with Sprint Planning to determine the scope of work.

The team holds a 15-minute Daily Standup to discuss progress and blockers.

At the end of the Sprint, we conduct a Sprint Review to demo work and a Retrospective to discuss process improvements.

3. Roles in Scrum

Product Owner: Manages the backlog and defines requirements.

Scrum Master: Facilitates the process and removes blockers for the team.

Development Team: Executes the work and delivers the increment.
